Big Data Assignment-3 Map Reduce

Mapper.py

```
#!/usr/bin/python3 -O

import sys

# Loop through each line in the input
for line in sys.stdin:
    # Remove leading and trailing whitespace
    line = line.strip()
    # Split the line into words
    words = line.split()
    # Emit key-value pairs of word and count of 1
    for word in words:
        print(word,"\t",1)
~
~
"mapper.py" 33L, 342B
```

Shebang Line:

- Specifies Python 3 interpreter.

Importing sys Module:

- sys module for system-specific functions.
- Provides access to system parameters.

Loop through Input Lines:

- Iterates over each line of input.
- Reads from standard input.

Stripping Whitespace:

- Removes leading and trailing whitespace.
- Ensures clean input. **Splitting Lines into Words:**
- Splits lines into words.
- Based on whitespace.

Emitting Key-Value Pairs:

- Prints word and 1.
- Separated by a tab.

Reducer.py

```
#!/usr/bin/python3 -O

import sys

# Initialize variables to keep track of current word and its count
current_word = None
current_count = 0

# Loop through each line in the input
for line in sys.stdin:
    # Split the line into word and count, separated by tab
    word, count = line.strip().split('\t', 1)

    # Convert count to integer
    count = int(count)

    # If the word is the same as the current word, increment its count
    if word == current_word:
        current_count += count
    else:
        # If the word is different, print the current word and its count
        if current_word:
            print(current_word,"\t",current_count)
        # Update current word and its count
        current_word = word
        current_count = count

# Print the last word and its count
if current_word:
    print(current_word,"\t",current_count)
~
~
"reducer.py" 33L, 863B
```

Shebang Line:

- Specifies Python 3 interpreter.

Importing sys Module:

- sys module for system-specific functions.
- Provides access to system parameters.

Initialization:

- Initialize variables for word and count.
- current_word and current_count.

Loop through Input Lines:

- Iterates over each line of input.
- Reads from standard input.

Splitting Lines into Word and Count:

- Splits each line into word and count.
- Separated by tab, limiting to one split.

Converting Count to Integer:

- Converts count from string to integer.

- Ensures numerical operations.

Incrementing Word Count:

- Increments count if word is the same.
- Accumulates count for the same word.

Printing Word Count:

- Prints current word and count.
- Separated by tab.

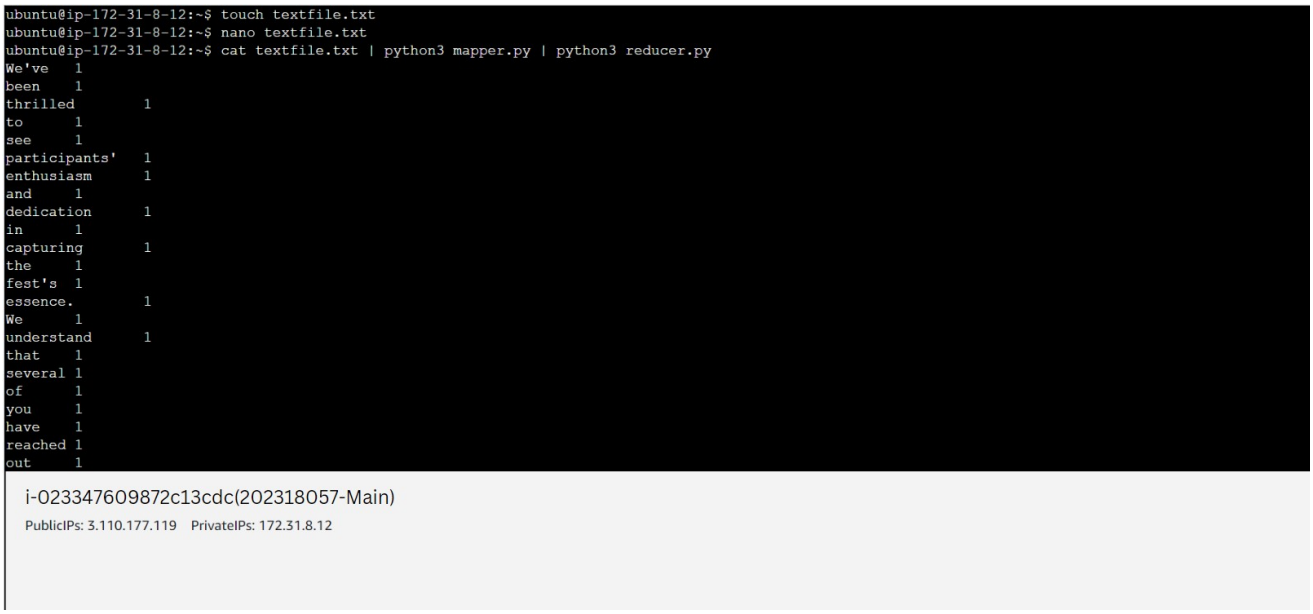
Updating Current Word and Count:

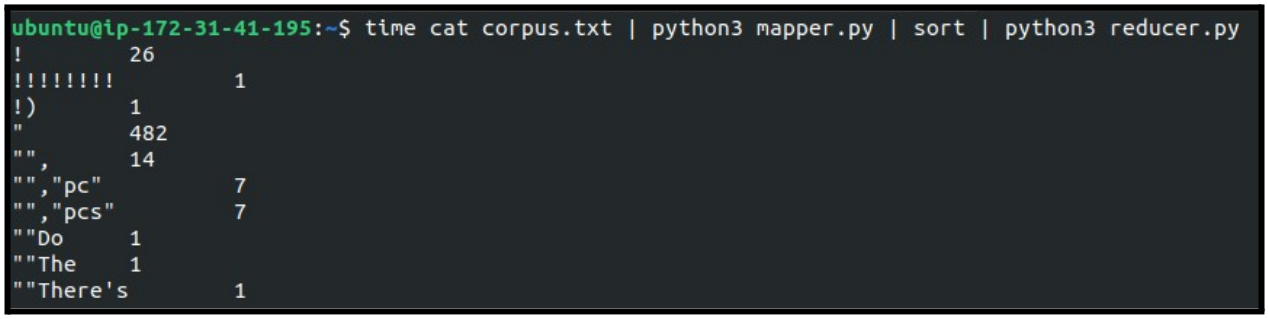
- Updates current word and its count.
- Prepares for the next word.

Printing Last Word and Count:

- Prints the last word and its count.
- Ensures all counts are accounted for.

SingleNode , used txt file corpus.txt ~ 90 mb





Without Hadoop

```
number  1

```
    # parse the input we got from mapper.py
    word, count = line.split('\t', 1)

    # convert count (currently a string) to int
    try:
        count = int(count)
    except ValueError:
        # count was not a number, so silently
        # ignore/discard this line
        continue

    # this IF-switch only works because Hadoop sorts map output
    # by key (here: word) before it is passed to the reducer
    if current_word == word:
        current_count += count
    else:
        if current_word:
            # write result to STDOUT
            print ('%s\t%s' % (current_word, current_count))
        current_count = count
        current_word = word

# do not forget to output the last word if needed!
if current_word == word:
    print ('%s\t%s' % (current_word, current_count))
